

ABSTRACT OF THE DISCLOSURE (Revised)

In a medical diagnosis system, user's medical information received by a communication unit are analyzed by analyzing unit with reference to the medical information stored in first data storage unit. A data-extracting unit extracts the result analyzed by the analyzing unit, the content of doctor's questions from a doctor's questions storage unit, and information of the user from the first data storage unit according to the result analyzed by the analyzing unit, and determines a physician suitable for the health condition of the user. The result analyzed by the analyzing unit or the content of doctor's questions is sent to a user terminal through the communication unit. An advice of a specialist to have close examination and a selected physician's name are sent to the user terminal through the communication unit. The information of the user and request for consultation are sent to a physician terminal.
